The image shows a Chrome security warning page with two states: before and after clicking 'ADVANCED'. A red arrow points from the 'ADVANCED' button in the first state to the 'Proceed to 10.49.10.11 (unsafe)' button in the second state.

State 1 (Left): A red padlock icon with an 'X' is at the top left. Below it, the text reads "Your connection is not private". Underneath, it says "Attackers might be trying to steal your information from **10.49.10.11** (for example, passwords, messages, or credit cards). NET::ERR_CERT_COMMON_NAME_INVALID". There is a checkbox for "Automatically report details of possible security incidents to Google. [Privacy policy](#)". At the bottom left, the word "ADVANCED" is circled in red with a red circle containing the number "1" next to it. A blue "Back to safety" button is at the bottom right.

State 2 (Right): The same warning is shown, but the "ADVANCED" button is now "HIDE ADVANCED". Below this, the text reads "This server could not prove that it is **10.49.10.11**; its security certificate is from **PRTG Demo Certificate**. This may be caused by a misconfiguration or an attacker intercepting your connection." At the bottom, the button "Proceed to 10.49.10.11 (unsafe)" is circled in red with a red circle containing the number "2" next to it. A blue "Back to safety" button is at the bottom right.
